

The Monitoring Core (M-Core): Toward Fully Securing Heterogeneous Wireless Sensor Networks

CAP Group @ Georgia Institute of Technology - *Georgia State University

MAIN IDEA

The M-Core is a modular, extensible and lightweight security layer that gathers relevant data for the development of defense mechanisms. Similar to Metasploit, which significantly reduces the time to manufacture an exploit, the M-Core is being developed to reduce the design and development time for new detection and defense mechanisms for WSNs.. The M-Core allows for the monitoring of both internal and external threats simultaneously facilitating the execution of new or existing detection and defense techniques against different attacks in parallel.

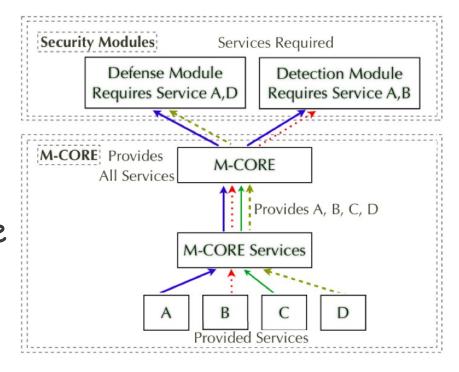

THE MONITORING CORE (M-CORE)

M-Core: To Support Distributed Security Systems

- Wireless Sensor Networks (WSNs) are deployed for monitoring in different domains (e.g., health care, military, critical infrastructure) and should be resilient to attacks.
- The problem with the traditional approach to defending sensor networks is that the solution for the Jamming attack does not defend against other attacks (e.g., Sybil and Selective Forwarding).
- M-Core addresses the challenges with the traditional approach to securing sensor networks and presents a comprehensive framework that can defend against all known and forthcoming attacks.
- M-Core has a built-in modular and flexible software architecture that provides an easy means to add, remove, and replace sub-modules. It is a lightweight monitoring and control layer invisible to upper layers.

M-CORE ARCHITECTURE

The M-Core services module advertises all the services provided by the sub-modules to the M-Core module, and the M-Core module allows the security modules to access those services.

To implement a defense mechanism against Sybil Attacks, our sybil module uses the rssivalue interface (service) provided by the RSSI sub-module of the M-Core.

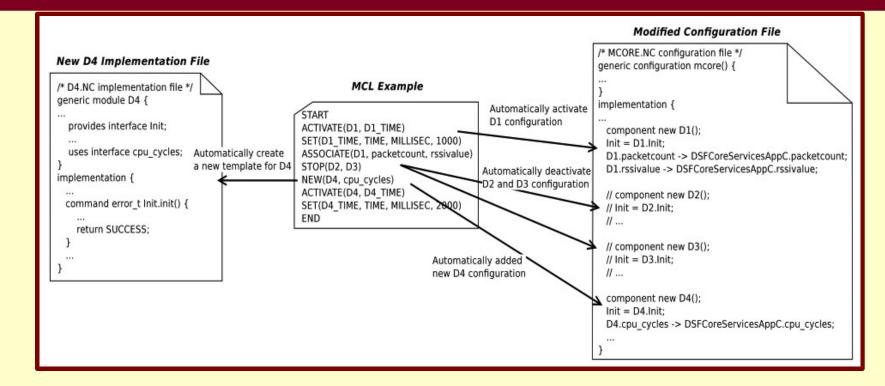

M-CORE SERVICES

channelScanchannelinfogetConsecutiveSuccessReturns the number of consecutive successfully sent packetsgetppsReturns the number of received packets per secondsetThresholdSets the threshold for acceptable consecutive sent packets ratepacketCountgetPacketCountReturns the total number of received packetsResurns the number of packets lost by each nodeReturns the number of packets lost by each nodeRSSIrssivaluegetRssiTableReturns neighbors RSSI tableSensingsensingstatgetAvgSenseValueReturns the average sensed value aggregated at the M-CoreneighborsCommneighborsrequestTriggers a neighbor discovery messagecurrentNeighborsneighborsReturns the number of current neighborspacketInformationpacketsinfoReturn the packets information tableInitializes packet information tableInitializes packet information table	Component	Interface	Commands/Events	Action

THE M-CORE CONTROL LANGUAGE (MCL)

- Facilitates the use of the M-Core.
- Simplifies the development of new defense mechanisms.
- Utilizes the M-Core sub-modules to activate, deactivate or create new defenses.
- Generates all programming components needed for the underlying sensor software architecture (e.g., configuration files, module files and wiring).

MCL EXAMPLE

Using M-Core and MCL, we implemented detection and defense mechanisms against Jamming, Selective Forwarding, Sybil, and Internal attacks representing different layers of the communication stack simultaneously on sensors.

TESTING M-CORE

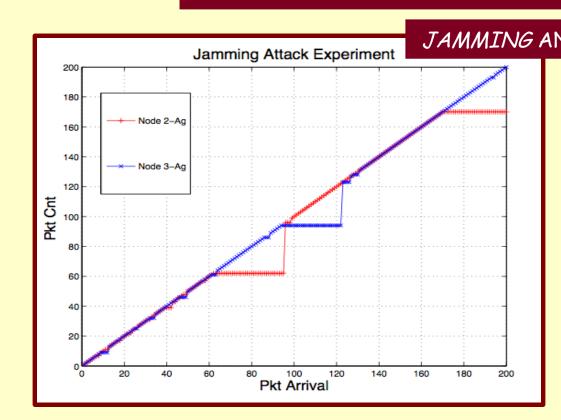

M-CORE INFO

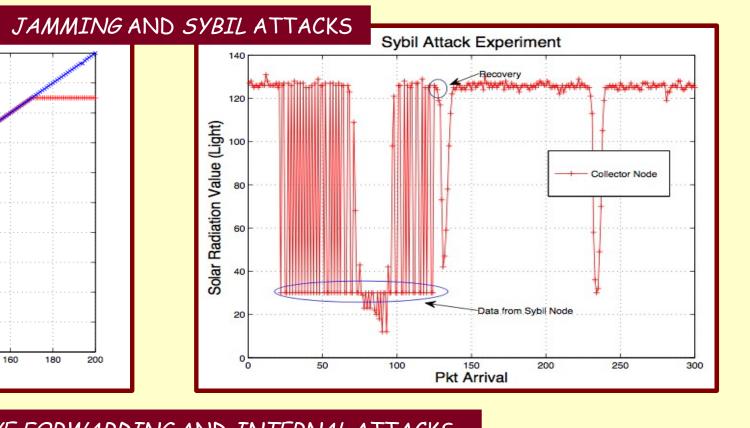

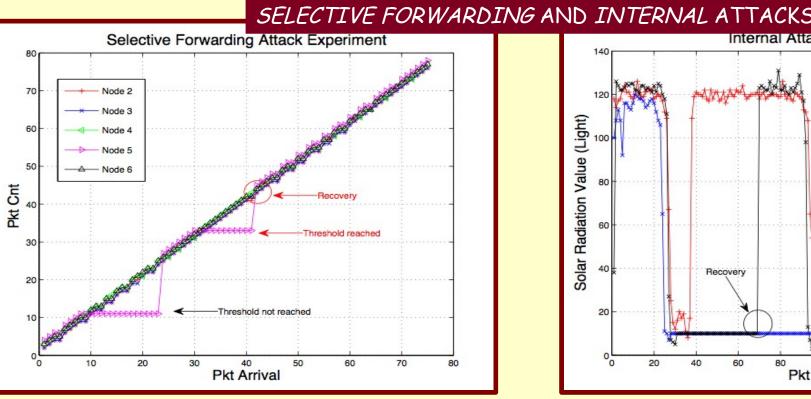

Memory Foo	Memory Footprint	
TYPE	ROM	RAM
Plain	18172	1641
Plain w/Security	20838	1743
